

# Kaleidoscope Data Base™

A brand new concept of Data Base technology, which operates on a principle called "Harmonics", utilizes only 800 bits of storage and is accessed by what we call "Sweepers".

The storage capacity is unlimited and a free-form structure is employed which does not utilize strings to access data. Masks may be used. Data is never deleted - only flagged.

We are seeking ONE bold licensee to market a novel new Data Base concept which will revolutionize the field of mathematics.

It is capable of solving the necessity of mathematical estimation which is a basic reason for much of mathematic's usage of "approaches to limits".

It will open new avenues for analyzation since it can encircle massive amounts of data in a small space, compare and extract, on a non-string search machine, in the blink of an eye and hence make artificial intelligence a very real human-like artform.

**NOTE: It will not come cheap!**
